

MARBLING MACHINES

MARBLING MACHINES - FIORETTATRICI

On plates of various metals the MARBLING MACHINES - FIORETTATRICI RONZANI automatic grinders carry out the special overlapped and crossed circular brushing finish known as "FIORETTATURA" or MARBLING finish. Other patterns are also available, like longitudinal strips and waves.

The MARBLING - FIORETTATRICI RONZANI automatic grinders come in different series: ROLLERS, COMBINED and BENCH. What mainly distinguishes them is how they move the plate: intermittently for the Rollers series, continuously for the Combined series and without moving the plate for the bench series.

What all the versions have in common are the Marbling units. The working units width is 12" which, using or excluding two or more units, gives a working width like the standard sheets of 24", 36", 48", 60", 72".

The centre distance of the spindles is for a maximum tool diameter of 60mm, but it is possible use tools of 50mm and 40mm diameters too.

The ROLLER and COMBINED series may be used to apply the protective film, either at the same time as the marbling work or only to protect the plates. These series come with a suction hood to clean the plate before the protective film is applied.

Each machine can work with or without loaded and unloaded roller conveyors and can be supplied with equipments to move, load and unload the plates.
